Introduction

Oral submucous fibrosis (OSF) is a chronic progressive fibrosing disorder of the oral cavity. Commonly in fibrosis, TGF- β 1 promotes the transdifferentiation of fibroblasts into α -smooth muscle actin (SMA)-secreting myofibroblasts. Integrin $\alpha\beta6$ is not detectable on normal oral keratinocytes but is upregulated during tissue remodelling. $\alpha\beta6$ is a key activator of TGF- β 1 through its interaction with its latency associated peptide.

$\alpha\beta6$ -dependent. *In vitro* findings were confirmed by immunochemistry, which demonstrated SMA-, pSmad2 and Smad4-positive myofibroblasts in OSF connective tissue. Finally, treating oral keratinocytes with the areca nut alkaloid arecoline upregulated $\alpha\beta6$ expression. In summary, we show that $\alpha\beta6$ integrin is strongly expressed in OSF, and that it promotes myofibroblast transdifferentiation by activating TGF- β 1. These data suggest a possible mechanism for the chronic fibrosis seen in OSF.

Objective

To investigate the role of $\alpha\beta6$ integrin in the pathogenesis of OSF.

Methods

$\alpha\beta6$ expression was examined in 41 OSF cases compared with 14 cases of fibroepithelial hyperplasia by immunohistochemistry. TGF- β 1 activation assays were carried out using a keratinocyte cell line expressing high levels of $\alpha\beta6$ (VB6). VB6 cells were co-cultured with HFFF2 fibroblasts and SMA expression examined by Western blotting and confocal microscopy.

Results and conclusion

$\alpha\beta6$ was highly expressed in 54% of OSF cases. $\alpha\beta6$ activated TGF- β 1, which was significantly reduced by antibody blockade. Co-culture experiments revealed markedly increased SMA expression by fibroblasts, indicating myofibroblast transdifferentiation, which was
